PERCEPTION 1D
Search 2D
STRENGTH 4D
Lifting 6D, Stamina 5D
TECHNICAL 1D

Equipped With:
Single Video Sensor (human range), 2 x Audio Sensors
Terrain-mapping sensor (+2D to find scrap & salvage)
Repulsorlift Motivator System
4 x Heavy Lifting Arms (+2D to Lifting)
Basic Vocabulator System
Small (20cm. by 8 cm.) internal "cargo" area
Some additional tools and equipment

Move: 12

Description: The P-100 pick-up droid, also known simply as the pick-up droid, was a droid used for manual relocation of large items. It could be deployed from the underside of P-100 Salvage Droids to retrieve valuable parts from crashed podracers and return them to the storage hold of the P-100.

The P-100 was a multi-armed salvage droid commonly deployed from the underside of a large transport craft. They were largely used to retrieve scrap parts from crash sites on Podrace courses. Once the P-100 droids were reloaded into the holding arm, it would return to the main podrace arena to drop off collected parts. If an owner did not claim their parts within two hours they would either be auctioned or sold, often to Jawas.

Smaller variants of this model were used for the transport of luggage and other small cargo on Coruscant.
